Pre-Exposure Prophylaxis (PrEP) Training for Providers in Clinical Settings

Participant Manual
Version 3.0
Pre-Exposure Prophylaxis (PrEP) Training for Providers in Clinical Settings: Participant Manual, Version 3.0, was developed by ICAP at Columbia University in collaboration with the U.S. Centers for Disease Control and Prevention (CDC), with funding from the U.S. President’s Plan for AIDS Relief (PEPFAR) under the terms of cooperative agreement #U2G-GH000994. Its contents are solely the responsibility of the authors and do not necessarily represent the views of the U.S. Government.

The training was developed as a set of tools that are adaptable to each county’s context and guidelines. The use of PrEP is evolving, so it is expected that these documents will require updating over time as recommendations change.

Organizations and entities that choose to adapt these documents for their own use should credit ICAP at Columbia University and note that their work is an adaption.

For questions about the contents or use, please contact ICAP at icap-communications@columbia.edu.

Foreword

Despite remarkable progress in HIV treatment, annual new infections have hovered close to 2 million globally for several years, with an estimated 1.8 million new HIV infections in 2017. Thus, large numbers of individuals remain at substantial risk for acquisition of HIV infection. Key populations at substantial risk include sex workers (SW), men who have sex with men (MSM), transgender persons (TG), and people who inject drugs (PWID), as well as other priority populations such as sexually active adolescent girls and young women in southern Africa. These realities compel the need for continued efforts to expand access to effective HIV prevention interventions while at the same time continuing the scale-up of access to HIV treatment programs for individuals living with HIV.

PrEP is an efficacious HIV prevention intervention. It involves the use of antiretroviral drugs (ARVs) by HIV-negative persons to prevent acquisition of HIV. Several clinical trials have demonstrated the efficacy of PrEP in MSM and transgender women, serodiscordant couples, heterosexual men and women, and PWIDs. PrEP is provided as a component of a package of HIV prevention interventions, including: regular HIV testing; promotion and provision of condoms; screening and management of sexually transmitted infections (STIs); risk reduction counseling; and harm reduction interventions. There is global consensus that PrEP is an important tool in the package and that it should be offered to people at substantial risk for HIV infection as part of a combination HIV prevention approach.

Health care providers, and HIV service providers in particular, are important gatekeepers of PrEP and play a crucial role in creating HIV prevention programs that are effective and that reach the individuals who would most benefit from PrEP. The goal of ICAP’s PrEP training package is to equip clinical providers with the skills to provide PrEP in a safe, effective manner. The training provides information on the evidence for PrEP effectiveness, on PrEP procedures, and on monitoring and evaluation of PrEP service delivery. PrEP offers a unique opportunity to confront the HIV epidemic, prevent HIV acquisition by individuals at risk for HIV, and reach global targets.

This training is intended for healthcare workers who are already familiar with the basics of HIV prevention, care, and treatment. It is anticipated that facilities will need to adapt this training to reflect specific contexts and to include evidence from new research and experience in the use of PrEP.

TRAINING OVERVIEW

Training Goals and Development

The goal of the Pre-Exposure Prophylaxis (PrEP) Training for Providers in Clinical Settings is to equip HIV care providers with the knowledge and skills necessary to provide PrEP to appropriate candidates and with high quality in order to decrease the risk of HIV infection.

ICAP at Columbia University used a backward design approach to develop this training. First, content and training experts were identified. Together, these experts developed a series of competency statements (tasks or skills) that HIV care providers would need in order to provide PrEP to appropriate candidates with the required level of proficiency. Next, the team created learning objectives and assessment measures to describe what HIV care providers should be able to achieve at the end of the training program. These learning objectives were then sequenced and grouped into 6 learning modules. Finally, the team created learning activities and training tools for all learning objectives. Training tools include a trainer manual, a participant manual, job aids, tools for monitoring and evaluation (M&E), and a comprehensive slide set with essential content, visuals, and talking points.

Competencies and Content Areas

During the training, health providers will develop core competencies—specifically, they will be able to:

- Identify eligible candidates for PrEP.
- Assess individual risk for HIV.
- Educate and counsel PrEP candidates and users.
- Assess medical eligibility for PrEP.
- Prescribe PrEP.
- Conduct clinical and laboratory assessments during follow-up PrEP visits.
- Determine how PrEP M&E tools can be used locally.
- Provide adherence education, counseling and support to PrEP candidates and users.

This is a classroom-based training. Content areas include:

- PrEP basics.
- PrEP screening and eligibility.
- Initial and follow-up PrEP visits.
- Monitoring and managing PrEP side effects, seroconversion, and stigma.
- M&E tools for local use.
The target population for this training includes providers and related health care team members with existing knowledge and experience in HIV prevention, care, and treatment programs, including:

- Physicians.
- Medical officers.
- Clinical officers.
- Nurses.
- Nurse midwives.
- Prevention and treatment counselors.
- Lay or peer outreach workers and educators.
- M&E staff.

**Participant Manual**

The participant manual is divided into 6 modules, each containing the learning objectives, all content to be delivered (from the slides), scenarios, role-plays, and instructions for pair and small group activities. Participants will use the manuals throughout the training. In some training sessions, participants will close their manuals in order to attend to an interactive trainer presentation. In other sessions, participants will have their manuals open in order to read content or follow activity instructions. Participants should retain their manuals after the training’s end. Please review the entire participant manual before leading the training.
PrEP Resources

PREP RESOURCES FOR PROVIDERS

PrEP Resources for PrEP Users

MODULE 1: PrEP BASICS

LEARNING OBJECTIVES
After completing Module 1, participants will be able to:

- Define PrEP.
- Differentiate PrEP from post-exposure prophylaxis (PEP) and antiretroviral therapy (ART).
- Describe the need for PrEP.
- Identify people at risk and people at substantial risk for HIV infection.
- Identify key populations (KPs) for PrEP at the local level.
- Explain the relationship between PrEP effectiveness and adherence.
- State the key reasons why PrEP is needed.
- Specify the PrEP regimens approved by WHO and within one’s own country.
- Identify concerns regarding the implementation of PrEP.
- Explain the risks and benefits of PrEP.

INTRODUCTION TO PrEP
HIV prevention needs change over a lifetime. Combination prevention is a mix of biomedical, behavioral, and structural interventions that decrease risk of HIV acquisition. Greater impact may come from combining approaches than from using single interventions alone.

Antiretroviral drugs (ARVs) used as PrEP provide an important additional prevention tool.
DEFINITIONS

PrEP is the use of ARVs by people who are HIV negative to prevent the acquisition of HIV before exposure to the virus.

- Pre = Before
- Exposure = Activity that can lead to HIV infection
- Prophylaxis = Prevention

PEP is short-term antiretroviral treatment to reduce the likelihood of HIV infection after potential exposure, either occupationally or nonoccupationally—for instance, through sexual intercourse.1

GLOBAL PROGRESS OF PrEP

- 2012: FDA approval in the United States
- 2015: WHO recommendation
- 2016: Southern African guidelines on PrEP for persons at risk, including adolescents
- 2018: Adolescents included in PrEP recommendations in the United States
- Regulatory approval in dozens of countries
- Access through programs and research in several others

DIFFERENCES BETWEEN PREP, PEP, AND ART

PrEP and PEP

<table>

<th>What is different?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>PrEP is started before potential exposure. PEP is taken after exposure.</td>
<td></td>
</tr>
<tr>
<td>PEP is taken for 28 days only. PrEP requires ongoing use as long as HIV risk exists.</td>
<td></td>
</tr>
</tbody>
</table>

1 http://www.who.int/hiv/topics/prophylaxis/en/
ART and PrEP
Treatment for HIV infection requires lifelong ART and consistently high adherence to achieve viral suppression.

PrEP is needed during periods of substantial HIV risk.

- Individuals taking PrEP receive regular risk assessment. Discontinuing PrEP is appropriate when they:
  - Are no longer at substantial risk for HIV infection.
  - Decide to use other effective prevention methods.

Motivation for adherence is different.

- ART is taken regularly by HIV-positive persons to remain healthy and keep from infecting others.
- PrEP is taken by HIV-negative persons who are largely healthy to avoid acquiring HIV infection.

WHY WE NEED PrEP
Several effective HIV prevention interventions already exist, including condoms and harm reduction for PWID.

- Global annual HIV infections have remained consistently close to 2 million for several years, declining in recent years.
- HIV incidence remains high among key and vulnerable populations: PWID, SWs, TG, MSM.

PrEP provides an additional prevention intervention to be used together with existing interventions like condoms.

PrEP is not meant to replace or be a substitute for existing prevention interventions.

(The trainer will provide information on local epidemiology.)

KEY POPULATION DEFINITIONS
“Key populations” are groups of people most at risk for contracting HIV. They include:

- Men who have sex with men.
- Transgender people.
- Sex workers.
- People who inject drugs.
- People in prisons and other closed settings.
- Clients of sex workers.
- Migrant workers.
- Fisher folk.
- Adolescent girls and young women (AGYW).

PREP STUDIES
ARVs Used in PrEP Trials

- **Oral daily tablet of TDF/FTC** (300mg tenofovir disoproxil fumarate/200mg emtricitabine)
- **Oral daily tablet of TDF** (300mg tenofovir disoproxil fumarate)
- PrEP using TDF/FTC and TDF alone are both equally safe and effective for heterosexual men and women.
- TDF alone was also found to be effective in PWIDs.
  - There is limited evidence on the use of TDF alone for PrEP in MSM.
- TDF/FTC was approved for PrEP by the Food and Drug Administration (FDA) in 2012.

iPREX Study

**Study Design**
- N = 2499 HIV-seronegative men (or transgender women)
- Sexual orientation: sex with men
- All received risk reduction counseling, condoms, and STI Rx

**Regimens**
- TDF/FTC (Truvada): 1 pill PO daily
- Placebo: 1 pill PO daily

**Result**
- 44% reduction in incident HIV in the TDF/FTC arm
TRAINING OVERVIEW

**PROUD**

Immediate vs. Deferred PrEP in High-Risk MSM in a “Real World” Trial

- Randomized, open-label trial of daily oral TDF/FTC PrEP in MSM in 13 STI clinics in London.
- Immediate (n = 267) vs. deferred for 12 months (n = 256)
- Primary endpoint: HIV infection in first 12 months from enrollment
- Results:
  - Incident HIV infection: 3 in immediate arm, 20 in deferred arm
  - Reduction 86% (90% CI 64-96, p=0.0001)
  - Number needed to treat for 1 year to prevent 1 infection: 13 (90% CI: 9-25)

**ANRS IPERGAY**

On-Demand Oral PrEP in High-Risk MSM

- Randomized double-blind trial.
- Event-driven oral TDF/FTC (n = 199) vs. placebo (n = 201).
  - 2 tablets taken 2–24 hours before sex
  - 1 tablet taken 24 hours after sex
  - 1 tablet taken 48 hours after first event-driven dose
- Primary endpoint: HIV seroconversion
- Results
  - 86% reduction in risk seen in PrEP arm (95% CI: 40-98, p = 0.002)
  - Median of 16 pills taken per month in each arm
  - Number needed to treat for 1 year to prevent 1 infection: 18

Evidence PrEP Works

PrEP efficacy was measured in:

- 11 randomized control trials (RCT) comparing PrEP with placebo.
- 3 RCTs comparing PrEP with no PrEP (e.g. delayed PrEP or “no pill”).
- 3 observational studies.
- Multiple demonstration projects across the globe.
PrEP was found to be effective in reducing HIV acquisition.

- PrEP was most effective in studies with high adherence.
- Quantifiable drug in plasma increased efficacy estimates to 74–92%.

**Global Expansion of PrEP**

- By late 2018, estimated 380,000 individuals prescribed PrEP, across nearly 70 countries.¹
- Over 20% of WHO member states had adopted guidelines for PrEP or were poised to do so.²
- National guidelines in low- and middle-income countries as well as high-income countries.
- Regional guidelines from:
  - *European AIDS Clinical Society*
  - *Southern African HIV Clinicians Society*
  - *Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine*

---

**PrEP USE IN A ROUTINE SETTING**

A large health care system operating in San Francisco, USA, assessed uptake of PrEP and PrEP outcomes from July 2012 to February 2015.

Among 801 individuals evaluated for PrEP:

- 82% initiated PrEP
- The mean duration on PrEP during the observation period 7.2 months.
- No HIV infections occurred.
- 30% of PrEP users were diagnosed with an STI in the 6 months following PrEP initiation.
- Among a small subset asked about behavior change during PrEP use, 56% reported no change in condom use; 41% reported a decrease in use; 17% reported increase in use.

---

Adherence

PrEP works when taken as prescribed! Both ART and PrEP must be taken correctly and consistently.

Trials in which PrEP use was more than 70% demonstrated the highest PrEP effectiveness (risk ratio = 0.30, 95% confidence interval: 0.21–0.45, P<0.001) compared with placebo.\(^2\)

As “Effectiveness and Adherence in Trials of Oral and Topical Tenofovir-Based Prevention” graph indicates, the higher the percentage of participant samples with detectable PrEP drug levels, **the greater the efficacy.**

---

**Adherence to drugs** means that an individual is taking prescribed medications **correctly and consistently.** It involves taking the correct drug in the correct dose:

- At a consistent frequency (the same number of times per day).
- At a consistent time of day.

**Adherence with follow-up** means that clients attend all scheduled clinical visits and observe all required protocols, including:

- Clinic and lab assessments.
- Prescription refills.

---

Countries Using PrEP

The medication used in PrEP has been approved in several countries—among them:

- Australia
- Belgium
- Botswana
- Brazil
- Canada
- Czech Republic
- Denmark
- France
- Kenya
- Lesotho
- Namibia
- Netherlands
- Peru
- South Africa
- Taiwan
- Thailand
- United Kingdom
- United States
- Zambia
- Zimbabwe
PREP REGIMENS AND SIDE EFFECTS

PrEP Regimens

**ARVs Recommended for Oral PrEP**

The World Health Organization (WHO) recommends oral PrEP regimens containing tenofovir disoproxil fumarate (TDF).

As PrEP, per WHO, consider these regimens:

- Combined tablet of emtricitabine (FTC) 200 mg/TDF 300 mg PO daily.
- Combined tablet of lamivudine (3TC) 300 mg/TDF 300 mg PO daily.
- Single-agent TDF 300 mg PO daily.

*(Note the limited evidence on the use of TDF alone for PrEP for MSM.)*

**PrEP Side Effects: Reports from RCTs**

In clinical trials, approximately 10% of participants experienced side effects. The side effects were mild and usually did not persist beyond the first month.

Side effects may include:

- Gastrointestinal (GI) side effects (nausea, vomiting, abdominal pain).
- Creatinine elevation (typically reversible).
- Loss of bone mineral density; recovers after stopping PrEP.

**Side Effects Reported from the iPrEx Open-Label Extension Observational Study**

In the multisite iPrEx Open-Label Extension (iPrEx OLE) Observational Study, a PrEP cohort taking daily oral TDF/FTC:

- 39% of participants reported any PrEP-related (mainly mild) side effects.
- A “start-up syndrome” has been reported: GI symptoms (nausea, flatulence, diarrhea, abdominal pain, vomiting), headaches, skin problems such as itching.
- The “start-up syndrome” is transient but can influence adherence:
- Side effects among PrEP users peaked around Month 1 and symptoms resolved by Month 3.
- Adherence counseling should focus on the transient nature of the start-up syndrome.
RISK BEHAVIORS, HIV DRUG RESISTANCE, AND SEXUALLY TRANSMITTED INFECTIONS

Will PrEP encourage people to use condoms less often or to have more sexual partners (i.e., “risk compensation”)?

- There was no evidence of this in clinical trials, where participants received regular counseling, screening, and access to condoms and lubricants.
- Evidence from real-world PrEP implementation shows declines in self-reported condom use and increases in STI diagnoses among some PrEP users.
- Combination prevention should include quality counseling and access to condoms and lubricants.

Will PrEP lead to more HIV drug resistance (HIVDR)?

- HIVDR in PrEP users was rare in clinical trials.
- HIVDR occurred mostly in cases where the person had undiagnosed HIV infection when starting PrEP.
- HIVDR will not occur when adherence to PrEP is high and HIV seroconversion does not occur.
- If adherence is suboptimal and HIV infection occurs while on PrEP, there can be risk of HIVDR.
- Optimal adherence to PrEP is crucial.
- Health providers must support and monitor adherence and teach PrEP users to recognize signs and symptoms of acute HIV infection.

Does PrEP protect against other STIs?

- PrEP does not protect against syphilis, gonorrhea, chlamydia, or human papilloma virus (HPV).
- Only condoms protect against STIs and pregnancy.
- PrEP protects against HIV.
- PrEP also provides modest protection against herpes simplex virus type 2 in heterosexual populations.
- PrEP should be provided within a package of prevention services, including STI screening and management, risk reduction counseling, condoms, and contraceptives.

Can PrEP be used with drugs or alcohol?

- Yes. Using drugs or drinking alcohol will not affect the safety or effectiveness of PrEP.
- However, drugs and alcohol could make you forget to take the PrEP tablets.

MODULE 1 SUMMARY

What We Know about PrEP

- PrEP can be used by HIV-negative persons to reduce the risk of HIV acquisition.
- Daily oral PrEP with TDF-containing regimens is currently recommended.
- PrEP should be taken as an additional prevention intervention.
- PrEP is effective if taken correctly and consistently.
- PrEP can be used by at-risk populations, including heterosexual men and women, MSM, SWs, PWID, and transgender women, among others.
- PrEP is safe and has minimal side effects.
MODULE 2: PrEP SCREENING AND ELIGIBILITY

LEARNING OBJECTIVES

After completing Module 2, participants will be able to:

- Name the 5 main eligibility criteria for PrEP.
- Use the standard medical screening form for PrEP eligibility and substantial risk.
- Name the contraindications for PrEP.
- Explain how to exclude acute HIV infection (AHI).

WHO SHOULD RECEIVE PREP?

WHO Recommendations

Oral PrEP containing TDF should be offered as an additional prevention choice for people at substantial risk for HIV infection as part of combination HIV prevention approaches.*

---

Exclude HIV Infection Before Starting PrEP

PrEP is a prevention intervention for people who are HIV negative.

All people at substantial risk for HIV and who may be eligible for PrEP should be offered HIV testing prior to PrEP initiation.

HIV testing must be done using national guidelines and algorithms.

- Ideally, use rapid HIV tests at point of care.
- Promptly link clients who test HIV positive to HIV treatment and care services.

(The trainer will provide the national algorithm.)
ACUTE HIV INFECTION

AHI is the early phase of HIV disease that is characterized by an initial burst of viremia. AHI infection develops within 2 to 4 weeks after someone is infected with HIV.

Approximately 40–90% of clients with AHI will experience “flu-like” symptoms.

- These symptoms are not specific to HIV but occur in many other viral infections.
- Clients with AHI can be asymptomatic.

Do not initiate a client on PrEP if AHI is suspected. The flu-like symptoms appear days to weeks after exposure and may include:

- Fever
- Fatigue
- Anorexia
- Rash (often erythematous maculopapular)
- Pharyngitis
- Generalized lymphadenopathy
- Mucocutaneous ulceration
- Headache
- Aseptic meningitis
- Radiculitis, myelitis
- May present with thrush, zoster, or other opportunistic infections (OIs), if CD4 depressed

These symptoms are not specific to HIV; they occur in many other viral infections.

Remember, many clients with AHI are asymptomatic.
Diagnosis of AHI

- During AHI, antibodies might be absent or be below the level of detection.
  - Serological testing using rapid tests might be negative.

- AHI can be diagnosed using “direct” viral tests like HIV RNA or HIV antigen testing.

- In the absence of HIV RNA and antigen testing, if AHI is suspected, PrEP should be deferred for 4 weeks.
  - Repeat the HIV serological test after 4 weeks to reassess eligibility.
SUBSTANTIAL RISK FOR HIV INFECTION

Potential Signs of Risk

Situations that may prompt a person to consider starting PrEP include:

- Alcohol and recreational drug use before sex.
- Leaving a long-term monogamous relationship.
- Leaving school or home at an early age.

Screening for Substantial Risk

- Screening questions should be framed in terms of people’s behavior rather than their sexual identity and should refer to a defined time period (e.g., 6 months).
- It is important for PrEP providers to be sensitive, inclusive, nonjudgmental, and supportive.
- Be careful not to develop a screening process that might discourage PrEP use.

Screening Questions

General Screening Questions

In the past 6 months:

- ☐ Have you had sex with more than one partner?
- ☐ Have you had sex without a condom?
- ☐ Have you had sex with people whose HIV status you do not know?
- ☐ Are any of your partners at risk for HIV infection?
- ☐ Have you had sex with a person who has HIV?
**Serodiscordant Couples**

For a person who has a partner with HIV:

- Is your partner taking ART for HIV?
- Has your partner been on ART for more than 6 months?
- Do you regularly discuss your partner’s adherence to HIV treatment (i.e., at least monthly)?
- Do you know your partner’s last viral load? What was the result? And when was the testing done?
- Do you wish to have a child with your partner?
- Are you and your partner consistently using condoms?

**Additional Factors**

Are there aspects of your situation that may indicate higher risk for HIV? Have you:

- Received money, housing, food, or gifts in exchange for sex?
- Been forced to have sex against your will?
- Been physically assaulted by anyone, including a sex partner?
- Taken PEP to prevent HIV infection?
- Had an STI?
- Injected drugs or hormones using shared equipment?
- Used recreational or psychoactive drugs?
- Been required to leave your home?
- Moved to a new place?
- Lost your job?
- Had fewer than 12 years schooling or left school early?

**SERODISCORDANT COUPLES**

PrEP can protect the HIV-negative partner in a heterosexual relationship with an HIV-positive (i.e., serodiscordant) partner if:

- The partner with HIV has been taking ART for fewer than 6 months.
  - ART takes 3 to 6 months to suppress viral load.
  - In studies of serodiscordant couples, PrEP has provided a useful bridge to full viral suppression during this time.
- The HIV-negative partner is not confident of the HIV-positive partner’s adherence to treatment or has other sexual partners besides the partner on treatment.
- The HIV-negative partner is aware of gaps in the HIV-positive partner’s treatment adherence.
- The couple is not communicating openly about treatment adherence and viral load test results.
**CREATININE AND ESTIMATED CREATININE CLEARANCE**

Tenofovir disoproxil fumarate (TDF) can be associated with a small decrease in estimated creatinine clearance (eGFR) early during PrEP use. Usually this does not progress.

PrEP is not indicated if eGFR* is < 60ml/min.

\[
\text{eGFR} = \text{estimated glomerular filtration rate using Cockcroft-Gault equation:} \\
\text{Estimated CrCl} = \frac{\left[140 - \text{age (years)} \right] \times \text{weight (kg)} \times f}{\text{serum creatinine (μmol/L)}} / \left[72 \times \text{serum creatinine (μmol/L)}\right]
\]

You can use an online calculator to determine the eGFR:

**PrEP USE DURING PREGNANCY**

In settings with high-prevalence, generalized epidemics, women acquire HIV during pregnancy and breastfeeding.

Existing safety data support the use of PrEP in pregnant and breastfeeding women who are at continuing substantial risk of HIV infection. WHO guidelines state that there is no safety-related rationale for disallowing or discontinuing PrEP use during pregnancy and breastfeeding for HIV-negative women who are receiving PrEP and remain at risk of HIV acquisition.

Surveillance of maternal, pregnancy, and infant outcomes is ongoing to identify any safety concerns.

**WOMEN AND PrEP**

PrEP does not affect the efficacy of hormonal contraceptives. Taking them together does not make them less effective.

PrEP does not protect against pregnancy.

PrEP is safe and can be continued during pregnancy and breastfeeding.
WILLINGNESS TO USE PrEP AS PRESCRIBED

Education and counseling are provided to support clients to make an informed choice about PrEP. Clients must not be coerced into using PrEP. Research indicates that adherence is higher among people who are aware that they are at risk for HIV infection and are motivated to take PrEP.

The source for completing the screening form is the client.

CLINICAL SCENARIOS

Clinical Scenario 1
Joseph, a 22-year-old man, presents at the clinic because he is interested in starting PrEP. He reports using condoms sometimes during sex with his HIV-positive male partner. His partner is healthy and has been on ART for 4 years. His most recent viral load from “a few months ago” was reported as 1200 copies/mL. Their last unprotected intercourse was last week. Joseph is in good health and takes no medications. His rapid HIV antibody test today is negative.

- Is Joseph a candidate for PrEP?
- If so, what did you consider in order to determine eligibility?
Clinical Scenario 2
Marie, an 18-year-old woman, comes to the clinic because she feels sick and is afraid she might have HIV. She reluctantly explains that, during the past year, she has been having sex for money or gifts in order to support her 2 children. Some of her partners have used condoms and others have not. She does not know whether her partners have HIV. Marie reports that she has been feeling run-down and sick for the past few weeks. Her rapid HIV antibody test today is negative.

- Is Marie a candidate for PrEP?
- If so, why?
- What other information would you need in order to determine eligibility?

Clinical Scenario 3
Geraldine, a 30-year-old wife and mother, presents at the clinic because she has heard that she can get drugs that will prevent her from getting HIV. She suspects that her husband has been injecting drugs, as he has needle marks on his arms. Geraldine is afraid that her husband might have HIV and that he will infect her. She reports that her husband has not been tested. Geraldine’s rapid HIV antibody test today is negative.

- Is Geraldine a candidate for PrEP?
- If so, why?
- What other information might you need in order to determine eligibility?

Clinical Scenario 4
Daniel is a 25-year-old man who presents at the clinic seeking treatment for “blisters.” He reports that, during the past several days, he has had a few painful blisters around his mouth and on his genitals. He declines to report his sexual activity; he says he is a married man and faithful to his wife. He asks whether he can take just one pill for the blisters here at the clinic, so that his wife or neighbors do not find out that he is taking pills. Daniel does not want to take any medications ongoing, as his neighbors or church might find out and conclude that he has HIV. He declines to take an HIV test.

- Is Daniel a candidate for PrEP?
- Why?

SCREENING ROLE-PLAYS
Screening Role-Play Scenario 1
Justine, a 19-year-old sex worker with a live-in boyfriend, was born a male but has been living as a woman since she was 15. She has had sex with multiple male partners over the last 6 months, a few times without condoms. She does not know whether she has any STIs, but she has no symptoms.

Justine’s boyfriend is living with HIV and has been on ART for about a year. He has adhered to the treatment regimen very well and is in good health. Justine is proud of him for this. Justine and her boyfriend use condoms during sex.
A few weeks ago, Justine was tested for HIV after a scary encounter with a client. The test was negative. Justine has come to the clinic today because she is feeling poorly. She has had a fever and chills in recent days and wants medicine in order to feel better.

Participant Instructions: Skip sections 1 and 2 of the screening tool. Role-play sections 3, 4, and 6 of the screening tool. After the role-play, you will complete Section 5 with the whole group. In addition to the question prompts in Section 4, you may need to use other questions such as the ones brainstormed earlier.

Screening Role-Play Scenario 2

Lucien, 25 years old, is a married man who has sex regularly with men outside his marriage as well as with his wife. His wife does not know about the sex with men. With male partners, Lucien insists on using condoms during sex but he does not do so with his wife.

Lucien has come to the clinic because the last time he was with a man, the condom broke, and he is worried that he might have gotten HIV. He does not know the HIV status of his male sex partners. He assumes that his wife does not have HIV, but she has not been tested. He does not use drugs or share injecting material with others.

Participant Instructions: Skip sections 1 and 2 of the screening tool. Role-play sections 3, 4, and 6 of the screening tool. After the role-play, you will complete Section 5 with the whole group. In addition to the question prompts in Section 4, you may need to use other questions such as the ones brainstormed earlier.

MODULE 2 SUMMARY

PrEP Eligibility, Screening, Side Effects, and Contraindications

- Providers should inform and counsel potential PrEP users and conduct an individualized risk assessment.
- Eligibility for PrEP includes:
  - At substantial risk for HIV infection.
  - HIV seronegative.
  - No suspicion of AHI.
  - No contraindications to the ARVs used in the PrEP regimen.
  - Willingness to use PrEP as prescribed.
- PrEP screening questions should be framed in terms of a person’s behavior.
- Side effects in clinical trials were rare and when they occurred they were mild.
- Contraindications for PrEP include:
  - Current or suspected HIV infection.
  - Renal impairment as defined by estimated creatinine clearance of <60 ml/min.
MODULE 3: INITIAL AND FOLLOW-UP PrEP VISITS

LEARNING OBJECTIVES
After completing Module 3, participants will be able to:

- Specify the procedures for the initial PrEP visit.
- Demonstrate knowledge of national guidelines for HIV testing services (HTS) and local algorithms for HIV testing.
- Describe the rationale for and content of brief counseling during the initial PrEP visit.
- Follow the Integrated Next Step Counseling (iNSC) process to counsel clients on sexual health and PrEP adherence.
- Specify the suggested procedures for follow-up PrEP visits.
- Describe the rationale for and content of follow-up counseling at each visit.
- Name typical challenges that facilities and providers may face when implementing PrEP, and strategies for addressing those challenges.

INITIAL PrEP VISIT SUGGESTED PROCEDURES

<table>
<thead>
<tr>
<th>Investigation</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIV test using national HTS guidelines algorithm</td>
<td>• Assessment of HIV infection status.</td>
</tr>
<tr>
<td>AHI symptom checklist</td>
<td>• To assess for AHI.</td>
</tr>
<tr>
<td>Serum creatinine</td>
<td>• To identify pre-existing renal impairment.</td>
</tr>
<tr>
<td>Hepatitis B surface antigen (HBsAg)</td>
<td>• To identify undiagnosed hepatitis B (HBV) infection.</td>
</tr>
<tr>
<td>RPR</td>
<td>• To diagnose and treat syphilis infection.</td>
</tr>
<tr>
<td>STI screening</td>
<td>• To diagnose and treat STI.</td>
</tr>
<tr>
<td>Pregnancy testing</td>
<td>• To ascertain pregnancy.</td>
</tr>
<tr>
<td>Brief counseling</td>
<td>• To assess substantial risk for HIV.</td>
</tr>
<tr>
<td></td>
<td>• To discuss desire for PrEP and willingness to take PrEP.</td>
</tr>
</tbody>
</table>
Provider Checklist for Initial PrEP Visit
Use this checklist (in the Appendix of this manual) as overall guidance during initial PrEP visits. You may need to customize the list to align with national guidelines and practices at your facility, as it may not contain everything done at your facility during an initial PrEP visit.

Initial PrEP Counseling
Initial counseling should:

- Increase awareness of PrEP as a choice.
- Explain how PrEP works.
- Discuss sexual health and PrEP as part of combination HIV prevention.
- Help clients decide whether PrEP is right for them.
- Educate clients about the importance of adherence and follow-up visits.
- Explain symptoms of AHI.
- Review common adherence strategies
- Describe common PrEP side effects and side effect management.

Initial Visit Counseling Messaging

Key Initial Visit Counseling Messaging: PrEP Efficacy

PrEP works when taken regularly!
PrEP is effective when taken every day.

PrEP reaches maximum effectiveness after 7 daily doses.

PrEP does not prevent STIs other than HIV.
Using condoms with every act of sexual intercourse provides some protection against many of these infections.

PrEP does not prevent pregnancy.
Use effective contraception unless you want pregnancy.

PrEP is safe.
Health Care Worker Discussion Prompts for Initial PrEP Visits

Sexual Behavior

- What has been going on for you sexually over the past couple of months?
- How much of the time did you use condoms?
- What has made it easier to use condoms during sex? What has made it more difficult?
- What concerns do you have about your sexual activities?
- How might taking PrEP impact your sexual activity?

Drug Use

- Did you use any drugs in the last 12 months?
- If yes, which drugs (e.g., alcohol, opioids, stimulants, cannabis)?
- And how did you use them (smoking, orally, injecting)?
- When did you last use drugs (and which ones)?
- How often do you use drugs (once a year, once a month, once a week, once a day—or more frequently)?
- Has your drug use ever been a problem for you? [Note: Referral to drug services may be appropriate if locally available.]
- Do you think your drug use may put you at risk for becoming infected by HIV or transmitting HIV?

---

Plan for Staying HIV and STI Negative

- In what ways are you reducing your risk of getting HIV and other STIs now?
- What steps have you considered for the future?
- You are reducing your risk for HIV by deciding to take PrEP. Let’s talk about how PrEP fits into your risk reduction efforts. [Emphasize that PrEP will reduce the risk of acquiring HIV but it will NOT reduce the risk of acquiring other STIs.]
- What other ideas or plans, if any, do you have for staying HIV and STI negative?

Preparing for Effective PrEP Use

- Do you have any experience taking a medicine daily?
- What is your experience with taking a medicine daily?
- Are you now taking any medication on a daily, long-term basis? [If so, you may need to refer the client to a pharmacist or other health care provider.]
- When you have taken medicines in the past, how did you remember to take them? What helps you remember to take your pills?
- What is your plan for taking your PrEP pill daily?
- What will you do about taking your pill if you are away from home for a night or more?
- What will you do if you miss a dose of your PrEP pill?
- What is your understanding of possible PrEP side effects? How will you cope with side effects if you have them?

Understanding Context

Understanding social and cultural context is critically important.

- People at risk of acquiring HIV infection often experience stigma from multiple sources.
  - MSM, SWs, and PWID are criminalized in many places, making them reluctant to seek HIV care.
  - Transgender individuals often face stigma, discrimination, and violence.
- In health care settings, addressing barriers may also mean acknowledging and redressing the imbalance in power between the providers of services and those seeking services.
SUPPORTING ADHERENCE

Adherence Strategies

- Link PrEP to a daily routine or event like brushing teeth or eating breakfast.
- Take your pill at the same time every day.
- Identify what to do if a dose is missed.
- Use a pillbox.
- Identify significant others who can support PrEP adherence.
- Use reminder alarms, text messages, or a calendar.
- Have a back-up supply of pills in your bag or purse.
  - In case your routines are disrupted (i.e., if you stay out overnight, go on holiday, or skip meals), consider carrying extra pills.

Common Reasons for Low Adherence to ART

<table>
<thead>
<tr>
<th>Individual Factors</th>
<th>Medication-Related Factors</th>
<th>Facility-Related Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Forgetting doses</td>
<td>• Adverse events</td>
<td>• Distance to health services</td>
</tr>
<tr>
<td>• Being away from home</td>
<td>• Pill burden</td>
<td>• Access to pharmacies</td>
</tr>
<tr>
<td>• Changes in daily routines</td>
<td>• Complexity of dosing regimens</td>
<td>• Long waiting times to receive care and obtain refills</td>
</tr>
<tr>
<td>• Depression or other illness</td>
<td>• Dietary restrictions</td>
<td>• Burden of direct and indirect costs of care</td>
</tr>
<tr>
<td>• Limited understanding of treatment benefits</td>
<td>• In contrast to ART, PrEP requires taking just one tablet daily and does not mandate any dietary restrictions</td>
<td></td>
</tr>
<tr>
<td>• Lack of interest in or desire to take the medicines</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Substance or alcohol use</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Absence of supportive environment</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Fear of stigma and discrimination</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

PrEP pills can be taken any time of day, with or without food.

PrEP is safe and effective even if you are taking hormonal contraceptives, sex hormones, or nonprescription drugs.
Understanding Nonadherence: Voluntary vs. Involuntary

<table>
<thead>
<tr>
<th>Voluntary Nonadherence (intentionally by a client)</th>
<th>Involuntary Nonadherence (not intentionally by a client)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Not convinced PrEP is needed.</td>
<td>• Forgot to take pill.</td>
</tr>
<tr>
<td>• Does not believe PrEP works or is working.</td>
<td>• Forgot to refill prescription.</td>
</tr>
<tr>
<td>• Does not like taking pills.</td>
<td>• Has competing priorities (e.g., employment, child care).</td>
</tr>
<tr>
<td>• Has experienced side effects; wishes to avoid side effects.</td>
<td>• Has difficulty with personal organization and scheduling.</td>
</tr>
<tr>
<td>• Has experienced stigma while taking PrEP.</td>
<td>• Affected by depression or other unaddressed mental illness.</td>
</tr>
<tr>
<td>• Does not believe it is necessary to take every day.</td>
<td>• Cannot afford PrEP medication, laboratory tests, or other costs.</td>
</tr>
<tr>
<td>• Does not want to take with alcohol or other drugs.</td>
<td>• Does not want to come to the health care facility (or cannot afford to do so).</td>
</tr>
<tr>
<td>• Wishes to avoid others witnessing pill taking.</td>
<td>• Dissatisfaction with health care provider interactions.</td>
</tr>
</tbody>
</table>

Lessons from ART Programs

Health care providers can positively influence adherence in many ways. They can:

- Facilitate accurate knowledge and understanding of medication benefits and requirements.
- Express confidence in the effectiveness of PrEP.
- Prepare for and manage side effects.
- Identify social support.
- Build self-efficacy for adherence.
- Develop a routinized daily schedule that includes regular pill taking.
- Maintain an open line of communication with PrEP clients.
- Monitor adherence.

Approaches to PrEP Medication-Adherence Support

<table>
<thead>
<tr>
<th>Support Issue</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Understand PrEP—have adequate, accurate knowledge</td>
<td>• Briefly explain or provide materials about:</td>
</tr>
<tr>
<td></td>
<td>• Indications for medication.</td>
</tr>
<tr>
<td></td>
<td>• The anticipated risks and benefits of taking medication.</td>
</tr>
<tr>
<td></td>
<td>• How to take it (one pill per day).</td>
</tr>
<tr>
<td></td>
<td>• What to do if one or more doses are missed.</td>
</tr>
<tr>
<td></td>
<td>• Assess for misinformation.</td>
</tr>
<tr>
<td>Prepare for and manage side effects</td>
<td>• Educate on side effects to expect, for how long, how to manage them.</td>
</tr>
<tr>
<td></td>
<td>• Educate on AHI signs and symptoms and how to obtain prompt evaluation and care.</td>
</tr>
<tr>
<td>Foster self-efficacy</td>
<td>• Provide PrEP role models via on-on-one peer supporters or champions</td>
</tr>
<tr>
<td></td>
<td>• Establish PrEP support groups.</td>
</tr>
</tbody>
</table>
## Support Issue

<table>
<thead>
<tr>
<th>Routinized daily schedule</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Discuss how to integrate daily dose with other daily events and what to do when away from home.</td>
<td></td>
</tr>
<tr>
<td>• Recommend or provide medication-adherence tools: Pill boxes.</td>
<td></td>
</tr>
<tr>
<td>• Phone apps, pager, or SMS reminder services.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Provider support</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Regularly assess adherence.</td>
<td></td>
</tr>
<tr>
<td>• Ask for a client self-report.</td>
<td></td>
</tr>
<tr>
<td>• Use technology (SMS reminders, smart phone apps).</td>
<td></td>
</tr>
<tr>
<td>• Various providers or health care workers can support adherence (pharmacist, peer workers).</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Social support</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Discuss privacy issues for PrEP user.</td>
<td></td>
</tr>
<tr>
<td>• Offer to meet with partners or family members if they are supportive.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mental health and substance abuse</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Consider screening for depression or substance abuse problems.</td>
<td></td>
</tr>
<tr>
<td>• Provide or refer to mental health or substance abuse treatment and relapse prevention services when appropriate.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Population-specific challenges</th>
<th>Provider Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Consider tailored medication-adherence support for:</td>
<td></td>
</tr>
<tr>
<td>• Adolescents.</td>
<td></td>
</tr>
<tr>
<td>• People with unstable housing.</td>
<td></td>
</tr>
<tr>
<td>• Transgender women.</td>
<td></td>
</tr>
<tr>
<td>• Others with specific stressors that may interfere with medication adherence.</td>
<td></td>
</tr>
</tbody>
</table>

### Adherence Assessment and Promotion

Discuss adherence at each visit. When you do:

- Avoid putting your own judgment on a client in order to encourage a realistic, honest discussion about challenges or issues he or she may be facing.
- Encourage PrEP clients to self-report pill taking in order to understand their experience with adherence.
- Ask about adherence over the last 3 days. (Short-term recall tends to be better than long-term recall.)

Additional methods to monitor adherence:

- Pharmacy refill history.
- Pill count.

### Drug Supply

Clients who have some medication supply in reserve tend to show better adherence.

- Providing an **extra week’s supply of medication at the first visit** will ensure an adequate supply for daily dosing until the next visit.
- This is important in case the follow-up visit is delayed for any reason.
- If you cannot give an extra week’s supply, schedule the client’s next visit a week before pill supply will run out.
APPROACHES TO PROMOTING ADHERENCE

Several approaches can be used to promote PrEP adherence:

Motivational Interviewing—This helps PrEP users explore their feelings and motivations for PrEP use, and reasons for non-use of medicines and/or negative experiences with medicines.

Informed-Choice Counseling (ICC)—This was adapted from family planning to address the challenges of informing the choice of PrEP and developing a plan for adherence. More information on this approach can be found in “Guidance for Providing Informed Choice Counseling on Sexual Health for Women Interested in Pre-Exposure Prophylaxis (PrEP),” available at ww.fhi360.org.

Integrated Next Step Counseling (iNSC)—This method is discussed later in the training.

Essential Features of PrEP Adherence Counseling

The foregoing counseling approaches share 3 features. They are all:

- **Context specific:** Valuing each client’s context, situation and decisions.
- **Client centered:** Attentive to unmet needs that may challenge PrEP use or adherence.
- **Focused on problem solving:** Emphasizing the client’s choice.

Client-Centeredness

- The term “client-centered” refers to seeing clients as the expert on their lives. The counselor serves as a guide to assist in setting and reaching goals.
- Client-centered counseling emphasizes respecting an individual’s experiences and choices.
- The approach can increase a client’s motivation to use PrEP correctly, because it addresses clients’ perceptions about the consequences of nonadherence vs. adherence.

Focused on Problem Solving

- Problem solving is not counselor driven, with health care workers telling clients what their problems are or what they must do to fix those problems.
- PrEP counseling helps clients identify factors that either facilitate accessing PrEP, or are barriers to it.
- PrEP counseling helps clients identify the factors that influence their behaviors and develop strategies to reduce any barriers.

---

4 Adapted from: **WHO Implementation Tool for Pre-Exposure Prophylaxis (PrEP) of HIV Infection.** Geneva: World Health Organization; 2017. License: CC BY-NC-SA 3.0 IGO.
INTEGRATED NEXT STEP COUNSELING

Integrated next step counseling was used in the iPrEx OLE study to counsel individuals on sexual health promotion more generally, with specific emphasis on PrEP adherence for individuals on PrEP.

The model is client centered and focused on problem solving, starting with the client’s identification of personal goals and of barriers and facilitators to achieving those goals.

This counseling is a conversation about all the things someone is doing or considering doing to protect their sexual health.

iNSC is used to deliver negative HIV test results and serves both as post-test HIV counseling and as counseling on the decision to use PrEP in a single brief, targeted, tailored conversation.
iNSC Steps, Components, and Examples

<table>
<thead>
<tr>
<th>iNSC Step</th>
<th>Critical Components</th>
<th>Example Prompts</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Introduce</strong> the counseling session</td>
<td>Explain what you are talking about and why. Get permission to proceed.</td>
<td>I would like to take a few minutes to check in with you about your goals and how to meet them. Is that okay?</td>
</tr>
<tr>
<td><strong>Review the client’s experiences</strong></td>
<td>Ask about what the client already knows about PrEP and how he or she learned it.</td>
<td>Thank you. Can you tell me a little about what you have heard about PrEP and about your experiences with PrEP?</td>
</tr>
<tr>
<td><strong>Explore</strong> context of client-specific facilitators and barriers</td>
<td>Use open-ended questions to explore factors or situations that help make pill taking a little easier; and those that make it harder or a little more difficult.</td>
<td>What seems to make PrEP easy to take or harder to take?</td>
</tr>
<tr>
<td><strong>Tailor</strong> the discussion to focus on making pill taking easier</td>
<td>This pause allows the provider or counselor to consider how to tailor the next question based on information gathered in earlier steps.</td>
<td>Let me think for a moment about what you have said.</td>
</tr>
<tr>
<td><strong>Identify</strong> adherence-related needs</td>
<td>Guide the conversation toward identifying the client’s perceptions of what would help to best integrate PrEP use into daily life.</td>
<td>Given everything going on right now, what would need to happen for it to feel a little easier to work this regimen into your daily life?</td>
</tr>
<tr>
<td><strong>Strategize</strong> with the client on the next step</td>
<td>Work with the client to identify one or more viable strategies for increasing effective PrEP use.</td>
<td>How could that happen? What are some ideas for how you could approach that?</td>
</tr>
<tr>
<td><strong>Agree</strong> on which strategy will be tried next</td>
<td>Ask which strategy (or strategies) the client is willing to try or continue using.</td>
<td>Of the things that we have talked about, which might you be willing to try between now and the next time we meet?</td>
</tr>
<tr>
<td><strong>Close and document</strong> the session</td>
<td>Summarize the discussion and thank the client.</td>
<td>What I’m hearing is that ______ would really make it feel easier to work PrEP into your life and that you’ll give it a try between now and the next time we meet. Thank you for talking with me and I look forward to talking again.</td>
</tr>
</tbody>
</table>

HIV RISK REDUCTION STRATEGIES

Explore HIV prevention options with the client. PrEP is one of several options that can help a client decrease their risk of HIV infection, including:

- Consistent use of male or female condoms.
- Diagnosis and treatment of STIs.
- Mutual monogamy.
- Post-exposure prophylaxis.
- Needle and syringe access programs, opioid substitution therapy, and other harm reduction strategies.

PrEP is more effective when used in combination with other prevention options.

---

Peer Workers for PrEP
Outreach workers, including lay or peer workers, are uniquely able to engage people who may benefit from PrEP but do not routinely access health care.

Lay and peer workers can provide nonjudgmental, respectful support. Peers with PrEP experience can be effective role models. PrEP services that include lay providers from KP groups can help reduce client concerns about stigma and can help increase PrEP uptake.

Role of Peers in Promoting PrEP
Peers play an important role in promoting PrEP, delivering accurate messaging, and supporting adherence. They are an effective “first line” in introducing PrEP to clients at community events and outreach activities and in clinic waiting rooms.

Include peer providers in PrEP discussions and trainings.

INSC ROLE-PLAYS

iNSC Role-Play Scenario 1
Geraldine, a 30-year-old wife and mother, asks about starting PrEP. She presented at the clinic because she heard that she could get drugs that would prevent her from getting HIV. She suspects that her husband has been injecting drugs, because he has needle marks on his arms. Geraldine is afraid that her husband might have HIV and that he will infect her. She reports that her husband has not been tested. Geraldine’s rapid HIV antibody test today was negative. She is eager to start PrEP but worries that her husband might see her taking pills and become abusive or make her stop taking the medication.

iNSC Role-Play Scenario 2
Joseph, a 22-year-old man, presented at the clinic because he is interested in starting PrEP. He reports using condoms sometimes during sex with his HIV-positive male partner. His partner is healthy and has been on ART for 4 years. His most recent viral load from “a few months ago” was reported as 1200 copies/mL. Their last unprotected intercourse was last week. Joseph is in good health and is taking no medications. His rapid HIV antibody test today was negative. Joseph reports that he loves to live life from moment to moment. He says that he is not good at “following orders” and is worried that he might forget to take his pills.

PrEP FOLLOW-UP VISITS
Clients on PrEP require regular visits with the health provider. Programs should decide on the optimal frequency of visits for monitoring PrEP use. The suggested follow-up visit schedule is:

- A month after initiating PrEP.
- Every 3 months thereafter.

Outside regular monitoring visits, clients should also consult their providers if they experience adverse events, side effects, or signs or symptoms of AHI.
PrEP Follow-Up Counseling
During follow-up counseling, discuss:

- Current sexual health behaviors (e.g., sexual health and drug use behaviors).
- Non-PrEP sexual health protection strategies (e.g., condom use).
- Assessment of continued risk for HIV and continuing need for PrEP.
- Intention to remain on PrEP.
- Facilitators and barriers to PrEP use.
- Adherence problems.
- Common adherence strategies.
- Challenges of disclosure.
- Reasons for ongoing monitoring while on PrEP.
- **Dosing requirements** for highest protection.
- What to do **if a dose is missed**.
- How to recognize symptoms of AHI.
- **Side effects and side-effects management**.
- How to safely discontinue and restart PrEP (if appropriate).

### Follow-Up PrEP Visit Procedures

<table>
<thead>
<tr>
<th>Intervention</th>
<th>Schedule Following PrEP Initiation</th>
</tr>
</thead>
</table>
| Confirmation of HIV-negative status | • At one month follow-up  
• Every 3 months.                                           |
| Review the client’s HIV risk        | • Every visit                                                                                     |
| Address side effects                | • Every visit                                                                                     |
| Brief adherence counseling          | • Every visit                                                                                     |
| Estimated creatinine clearance      | • At least every 6 months, or more frequently if there is a history of conditions affecting the kidney, such as diabetes or hypertension |

In addition, at every visit:

- Provide STI screening, condoms, and contraception as needed.
- Counsel clients on AHI symptoms and advise them to come back as soon as possible for evaluation if these symptoms occur.

### Provider Checklist for Follow-Up PrEP Visits

- Use this checklist (found in the Appendix) as overall guidance during follow-up PrEP visits.
- You may need to customize the list to align with national guidelines and the practices at your facility, as it may not contain everything done at your facility during a follow-up PrEP visit.
Repeat HIV Testing
Repeat HIV testing is needed to inform decisions on whether to continue or discontinue PrEP. Repeat HIV testing using national guidelines:

- A month after starting PrEP.
- Every 3 months thereafter.

Remember the limitation of serological tests during AHI in the “window” period from HIV infection to detection of antibodies, and also that exposure to ARVs can decrease sensitivity of serological tests.

Stop PrEP if AHI is suspected.

Provider Checklist for Substantial Risk
You will use this checklist (found in the Appendix of this manual) during every follow-up visit to assess for substantial risk of HIV infection.

Assessing PrEP Adherence
Monitoring PrEP use and adherence is important. However, it is important that it be done in an open-ended and nonjudgmental manner. A neutral assessment of adherence allows for a constructive discussion that can support the client in finding solutions to adherence challenges. It is helpful to:

- Normalize adherence challenges:
  “Many people have trouble remembering to take a daily pill, especially when starting a new medication. Has this happened to you?”

- Instead of “Have you missed doses of your medication?” ask about difficulties adhering, not nonadherence:
  “Tell me about any difficulties you have had in taking your daily pill.”

Discussion Prompts for PrEP Follow-Up Visits

Sample Open-Ended Questions about Adherence

- How has it been for you to take PrEP?
- What side effects have you had, if any?
- What helps you remember to take your pill?
- What challenges do you experience in taking the pills? When are you more likely to forget?
- What are your concerns about missing PrEP pills?
- What have been your experiences with missing PrEP doses?
- What helps or might help you to take your pills regularly?

**Strategies to Help with PrEP Adherence**

- Use a pill box.
- Take PrEP pills with other daily medicines.
- Use a phone alarm.
- Mark doses taken on a calendar.
- Have more support from your partner, a family member, or a friend.
- What keeps you motivated to take the PrEP pills?
- What might help make taking PrEP even easier?

**Behavior and Activity**

- Has taking PrEP changed what else you do to protect yourself from getting HIV and STIs (for example, topping versus bottoming, using condoms, discussing HIV and STI status and/or testing with partners)?
- Has PrEP made you feel safer about sex?
- Has PrEP made it easier for you to take charge of your health?
- In addition to taking PrEP, what are your plans to stay HIV negative?

**Confirm a Clear Plan for Staying HIV and STI Negative**

- What I hear you saying is that you currently reduce your risk for HIV by [fill in protective behaviors] and also you talked about your desire or plan with [fill in name of person(s)]. Have I understood you correctly?
- What other ideas or plans, if any, do you have for staying HIV- and STI negative?

**PrEP DISCONTINUATION**

Starting PrEP does not mean staying on PrEP for life. People often move in and out of substantial risk for HIV. A variety of life changes may prompt a person to stop PrEP, for example:

- A partner with HIV achieves viral suppression on ART.
- A relationship becomes mutually monogamous.
- Sex work or injection drug use stops.
- Other risks change.

Education and support for safe stops and restarts of PrEP use are essential. A client who decides to stop PrEP should:

- Contact his or her health care provider.
- Continue to take PrEP for 28 days after the last potential exposure to HIV.

**PrEP CLINICAL PATHWAY**

This document is in the Appendix. The graphics may be customized to align with national guidelines.
INFORMATION, EDUCATION, AND COMMUNICATION

Facilities may use materials and activities for information, education, and communication (IEC) to address challenges around PrEP acceptance and adherence.

Frequently Asked Questions about PrEP

- During PrEP visits, you may use this job aid (in the Appendix) to ensure that all appropriate PrEP information has been given to a client.
- Clinics should adapt the list to their context, adding any questions that clients ask frequently.
- You may also want to add any questions and answers noted during our discussion as being frequently asked, if you think they would be helpful to your clients.

Representative IEC Materials

There are many online that will fit your local context; here are a few.

**U.S. Centers for Disease Control and Prevention Website**

- “PrEP.” https://www.cdc.gov/hiv/basics/prep.html

**IEC Materials from the New York City Government**

- http://www1.nyc.gov/site/doh/health/health-topics/prep-pep.page

**IEC Materials from South Africa**

**Demand Generation Resources from OPTIONS Consortium’s PrEP Communications Accelerator**

- http://accelerator.prepwatch.org/about/
Peer Outreach for Follow-Up
Trained peer supporters can play an important role in outreach to PrEP clients. Peer outreach workers may be better able to reach clients in community settings than other clinic staff.

Clients may feel more able to discuss adherence and retention challenges with peer supporters than with health professionals.

MODULE 3 SUMMARY

- Prescribe PrEP as part of a comprehensive HIV prevention strategy.
- Confirm a negative HIV test immediately prior to initiating PrEP.
- Ensure there are no contraindications to PrEP.
- Ensure clients have correct information about PrEP.
- Develop an adherence support plan with the client and monitor adherence at each visit.
- Conduct risk reduction counseling at each visit.
MODULE 4: MONITORING AND MANAGING PrEP SIDE EFFECTS, SEROCONVERSION, AND STIGMA

LEARNING OBJECTIVES
After completing Module 4, participants will be able to:

- Explain how to manage creatinine elevation.
- List additional causes of creatinine elevation.
- Explain how to manage seroconversion.
- Develop strategies to minimize PrEP stigma.
- Give examples of gaps in knowledge about PrEP.
- Describe how M&E tools might be adapted for local use.

MONITORING AND MANAGING CREATININE ELEVATION

Approximately 1 in every 200 PrEP users may develop an elevation of serum creatinine. This is defined as a 50% increase above baseline or an elevation above the normal range. Renal impairment is defined as having an estimated creatinine clearance of <60 ml/min. Creatinine elevations have usually reversed after stopping PrEP. It is important to monitor transient creatinine elevation and be alert for signs of chronic or severe renal insufficiency.

Managing Creatinine Elevation

Common causes of chronic or severe renal insufficiency include: diabetes mellitus, uncontrolled systemic hypertension, hepatitis C infection, liver failure, and preeclampsia during pregnancy.

- Discontinue PrEP if creatinine elevation is confirmed on a separate specimen and if estimated creatinine clearance decreases to <60 ml/min.
- After PrEP is stopped, creatinine should be checked for another 1 to 3 months and PrEP restarted if eGFR returns to > 60 ml/min.
- Consider additional causes and management of creatinine elevations if:
  - Creatinine elevation reaches more than 3 times the baseline.
  - Renal function or creatinine elevations do not return to normal levels within 3 months after stopping PrEP.

SEROCONVERSION ON PrEP

- In clinical trials, the level of protection was strongly correlated with adherence.
- HIV infection can be prevented with consistent use of PrEP.
- HIV seroconversion after prescribing PrEP can occur if PrEP is not used correctly or consistently, or if HIV infection was undiagnosed at the time of PrEP initiation.
- Counseling should include information to help PrEP users recognize AHI signs and symptoms, which should prompt a clinic visit without delay.

Managing Seroconversion
If a person using PrEP tests positive for HIV, PrEP should be stopped immediately and the person referred for prompt initiation of HIV treatment. Transition from PrEP to HIV treatment without a gap avoid the risk of resurgence in viral load, immunological injury, and secondary transmissions.

The PrEP M&E tools package includes a Seroconversion Tracker. Tracking seroconversion is important to inform gaps in care and identify needs for increased outreach to PrEP clients if adherence is an issue.

### PrEP SPECIAL SITUATIONS

<table>
<thead>
<tr>
<th>Situation</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hormonal contraception</td>
<td>• PrEP does not affect the efficacy of hormonal contraceptives and hormonal contraceptives do not affect PrEP efficacy.</td>
</tr>
<tr>
<td>Pregnancy and breastfeeding</td>
<td>• Safety data support the use of PrEP in pregnant and breastfeeding women who are at continued substantial risk for HIV infection.</td>
</tr>
<tr>
<td>Hepatitis B infection</td>
<td>• HBV vaccination is appropriate for people at substantial risk for HBV or HIV infection.</td>
</tr>
</tbody>
</table>
| Management of recent HIV exposure with PEP | • People who have been exposed to HIV in the past 72 hours should be offered PEP.  
• WHO recommends PEP consisting of TDF/3TC (or FTC), preferably combined with a boosted protease inhibitor, for 28 days (per national guidelines).  
• PEP may be transitioned to PrEP after 28 days if the HIV test remains negative and there is substantial ongoing risk of HIV acquisition. |

### MINIMIZING PrEP STIGMA

- Confidentiality is essential in PrEP services.
- People may face stigma if their PrEP use becomes known.
- PrEP use can exacerbate stigma if others mistakenly consider PrEP use to be evidence of irresponsible behavior or if they mistakenly think that PrEP is HIV treatment.
  - Such stigma will decrease PrEP uptake and adherence among people who would otherwise benefit from it.

Presenting PrEP to your communities as a responsible choice that protects both partners will increase the impact of PrEP, will prevent more HIV infections, and can help reduce stigma.
GAPS IN PrEP KNOWLEDGE AND NEED FOR CONTINUED SURVEILLANCE

Current gaps in knowledge related to PrEP implementation include:

- Renal safety of FTC/TDF PrEP in people with diabetes mellitus and uncontrolled systemic hypertension.
- 3TC use in combination with TDF for PrEP (although for HIV treatment, 3TC is equivalent to FTC).
- Comparison of daily vs. on-demand PrEP regimens.
- Effectiveness of on-demand oral PrEP regimens for women.
- Clinical HBV rebound when stopping FTC/TDF PrEP: Not observed among people with current HBV infection in clinical trials, though most excluded people with HBV infection.

WHO recommends offering PrEP as part of a comprehensive HIV prevention package that is integrated with PMTCT and antenatal and postnatal care programs in settings of high HIV incidence. However, there is a need for continued surveillance of maternal, pregnancy, and infant outcomes as PrEP is rolled out for women of childbearing age.

MODULE 4 SUMMARY

- PrEP users should be informed about how to recognize signs and symptoms of AHI.
- If someone using PrEP tests positive for HIV, stop PrEP immediately and start ART as soon as possible, without a gap after PrEP is discontinued.
- If confirmation of a positive HIV test result is delayed for more than a few hours, transition to fully suppressive ART (3 ARVs per national treatment guidelines).
- Ideally, blood creatinine (eGFR) should be measured before starting PrEP and at least every 6 months after PrEP is started. Initiation of PrEP should not be delayed while waiting for creatinine results.

MODULE 5: PrEP MONITORING
AND EVALUATION TOOLS

LEARNING OBJECTIVES
After completing Module 5, participants will be able to:

- Use the Provider Checklist for Substantial Risk during PrEP follow-up visits.
- Describe how PrEP M&E tools might be adapted for local use.
- Identify the correct order of the steps that health care workers should take during an initial PrEP visit.
- Identify at which steps of the initial PrEP visit the health care worker should complete or refer to the PrEP Screening Log, PrEP Screening for Substantial Risk and Eligibility form, Integrated Next Step Counseling Flow, PrEP Client Register, and PrEP Facility Record.
- Identify the correct order of the steps that health care workers should take during a follow-up PrEP visit.
- Identify at which steps of the follow-up PrEP visit the health care worker should complete or refer to the Provider Checklist for Substantial Risk, Integrated Next Step Counseling Flow, PrEP Client Register, and PrEP Facility Record.

MONITORING AND EVALUATION FORMS
The M&E forms covered in this module are:

- PrEP Screening for Substantial Risk and Eligibility
- PrEP Screening Log
- PrEP Facility Record
- PrEP Client Register
- Seroconversion Tracker
- PrEP Monthly Summary Form
- PrEP Quarterly Cohort Report

PrEP Screening for Substantial Risk and Eligibility (from Module 3)
- The client is the source for the information needed to complete this screening form.
PrEP Screening Log

- Complete the PrEP Screening Log after the initial PrEP Screening.
- The Screening Log should include everyone who is screened for PrEP, regardless of whether they are eligible for PrEP or decline it.
- The log shows how many of those screened are eligible for PrEP, and among those eligible, how many accept or decline PrEP.
- The source document to complete the Screening Log is the PrEP Screening for Substantial Risk and Eligibility form.
- The data help inform clinics and ministries of health of the PrEP eligibility and acceptability rate and the main reasons for ineligibility for and declining of PrEP.
- The data can inform increased outreach and education efforts and IEC materials.
- Ineligibility of a large number of people screened can inform how the screening form might be revised—for example, adding additional KP or vulnerable groups.

PrEP Facility Record

- This form is completed after the initial PrEP screening, for clients who agree to start PrEP.
- The provider must ask questions of the client in order to complete some sections of the form.
- Other sections are completed using test results and information obtained during PrEP screening.
- This form is completed with the client, along with consulting the PrEP Screening for Substantial Risk and Eligibility form.
- The form’s PrEP Follow-Up Visits section will be completed at each follow-up visit.

PrEP Client Register

- As each new client starts PrEP, the relevant information is added to this register, and the client’s follow-up visits are recorded.
- The Source document to complete this form is the PrEP Facility Record.

Seroconversion Tracker

Seroconversion can occur when:

- The client had AHI before starting PrEP.
- The client has had poor adherence and has been exposed to HIV.

Importance of the Seroconversion Tracker

- The tracker is completed during follow-up visits for PrEP clients who seroconvert to HIV positive.
- Source documents for completing this form are the PrEP Client Register and ART records.
- Refer to the Variable and Code Definitions as needed when completing the tracker.
• The tracker will help ensure appropriate linking and follow-up on clients diagnosed with HIV and can facilitate reporting of seroconversions for surveillance.

**PrEP Monthly Summary Form**

• Optimally, all data from all HIV testing points referring for PrEP within a facility should be combined and reported here.

• The number of clients testing HIV negative is the “denominator” for assessing coverage of who is eligible for PrEP screening. The data source for HIV testing and results table is the clinic’s HIV testing services registers.

• Source documents for completing this form are the PrEP Client Register and the PrEP Screening Log.

**PrEP Quarterly Cohort Report**

• This form is used to collect and track data per quarter and PrEP cohort.

• The source for completing this document is the PrEP Client Register.

**M&E PRACTICE SCENARIOS**

**M&E Practice Scenario 1**

Joseph, a 22-year-old man, presented at the clinic because he is interested in starting PrEP. He reports using condoms sometimes during sex with his HIV-positive male partner. His partner is healthy and has been on ART for 4 years. His most recent viral load from “a few months ago” was reported as 1200 copies/mL. Their last unprotected intercourse was last week. Joseph is in good health and takes no medications. His rapid HIV antibody test today was negative. Joseph reports that he loves to live life from moment to moment. He says that he is not good at “following orders” and is worried that he might forget to take his pills. Joseph has agreed to start PrEP.

**M&E Practice Scenario 2**

Marie, an 18-year-old woman, presented at the clinic because she feels sick and is afraid she might have HIV. She reluctantly explains that, during the past year, she has been having sex for money or gifts in order to support her 2 children. Some of her partners have used condoms and others have not. She does not know whether her partners have HIV. Marie reports that she has been feeling run-down and sick for the past few weeks. Her rapid HIV antibody test today is negative. After you determine that there is no suspicion of AHI, Marie has agreed to start PrEP.

**M&E Practice Scenario 3**

Geraldine, a 30-year-old wife and mother, is interested in starting PrEP. She presented at the clinic because she heard that she could get drugs that will prevent her from getting HIV. She suspects that her husband has been injecting drugs, as he comes home with needle marks on his arms. Geraldine is afraid that her husband might have HIV and that he will infect her. She reports that her husband has not been tested. Geraldine’s rapid HIV antibody test today was negative. She is eager to start PrEP but worries that her husband might see her taking pills and become abusive or make her stop taking the medication. Geraldine has agreed to start PrEP.
M&E Practice Scenario 4
Gabrielle, a 25-year-old married woman, has come to the clinic distressed because of her husband’s behavior. Lately, he has been staying out all night has needle marks on his arms when he returns. She is afraid that he might be using drugs. Gabrielle has come to the clinic to get medicine to protect against any infection that her husband might have. She feels that she cannot control his behavior, but she can try to protect herself.

Despite the problems with her husband, Gabrielle has sex (vaginal) with her husband almost every week. Her husband does not like to use condoms. Gabrielle does not know whether her husband has HIV, as he refuses to get tested; he says that such tests are for “bad people.” She fears, though, that he may be having sex with other women.

Gabrielle has not had any STIs. She has not taken PEP. She does not use drugs or share injecting material with others. She last had sex with her husband 2 nights ago. She feels fine and does not have a fever, or cold or flu-like symptoms. Her rapid HIV antibody test today is negative. Gabrielle has decided to start PrEP.

M&E Practice Scenario 5
Justine, a 19-year-old sex worker with a live-in boyfriend, was born a male but has been living as a woman since she was 15. She has had sex with multiple male partners over the last 6 months, a few times without condoms. She does not know whether she has any STIs, but she has no symptoms.

Justine’s boyfriend is living with HIV and has been on ART for about 1 year. He has adhered to the treatment regimen very well and is in good health. Justine is proud of him for this. Justine and her boyfriend use condoms during sex.

A few weeks ago, Justine was tested for HIV after a scary encounter with a client. The test was negative. Justine has come to the clinic today because she is feeling poorly. She has had a fever and chills in recent days and wants medicine in order to feel better. You determine that there is no suspicion of AHI. Justine agrees to start PrEP.

M&E Practice Scenario 6
Lucien, 25 years old, is a married man who has sex regularly with men outside his marriage, as well as with his wife. His wife does not know about the sex with men. Lucien insists on using condoms during sex with men but he does not do so with his wife.

Lucien has come to the clinic because the last time he was with a man, the condom broke, and he is worried that he might have gotten HIV. He does not know the HIV status of his male sex partners. He assumes that his wife does not have HIV but she has not been tested. He does not use drugs or share injecting material with others. Lucien’s HIV test is negative. He agrees to start PrEP.

M&E Practice Scenario 7
Anne, a sex worker, is interested in starting PrEP. She uses condoms during sex with clients but not with her stable partner, whose HIV status is unknown. She had a negative HIV test 6 months ago and wants to avoid HIV infection, because she would like to have a baby with her partner. She is using an injectable hormonal contraceptive as she used to forget to take her oral contraceptives every day. Anne’s HIV test is negative. She has decided to start PrEP.
### SAMPLE DATA FOR PrEP MONTHLY SUMMARY FORM

#### Clients Who Received HIV Testing for PrEP Screening

Instructions for PrEP Quarterly Cohort Report
Use your completed PrEP Monthly Summary Form and the information (below) to complete the PrEP Quarterly Cohort Report for Cohort 1.

- Transferred in: female, age 24, HIV status negative, sex worker.
- Transferred in: male, age 55, HIV status negative, has sex with men.
- Female, age 19, injects drugs, stopped PrEP due to positive HIV test.
- No PrEP clients stopped because they were no longer at substantial risk.
- Male, 45, has sex with men, was lost.
- No PrEP clients from this cohort died.

ENTRY POINTS FOR PrEP

- Outpatient clinic or facility
  - HIV testing (the most common)
  - Testing for STIs
  - Sexual and gender-based violence services
  - Harm reduction and other drug treatment services
  - Antenatal services
- Gynecology and reproductive services
- Inpatient
  - Referred from emergency room or hospital staff
- Community-based and outreach HIV testing—clients tested in community outreach settings may be referred for PrEP.
- PMTCT—HIV-negative partners of HIV-positive pregnant women may be referred for PrEP.
- PEP services—Clients completing PEP services may be referred for PrEP.

PEP to PrEP Transition

- Clients who present recurrently for PEP may be candidates for PrEP.
- PEP encounters should be viewed as a prevention opportunity to help at-risk persons engage in sustained risk reduction and HIV prevention services, including PrEP.
- PrEP offers more consistent protection against HIV than repeated courses of PEP.

Entry Points for PrEP for M&E Use

- If your facility has multiple points of entry, consider adapting the PrEP M&E tools to capture these points.
- This will provide very useful information about where PrEP clients come from, which will help to inform national prevention and demand creation strategies.
**PrEP CLIENT AND CLINIC FLOW**

The PrEP Client Flow describes the sequence of PrEP services that new and returning clients receive. The client flow should be adapted to fit clinic structure and existing procedures.

**PrEP Client and Clinic Flow—Initial Visit Steps**

- **Health care workers should use the Provider Checklist for Initial PrEP Visit as a guide throughout the initial PrEP visit.**

1. The client arrives at the facility for HTS.
2. The client receives HIV pre-test counseling.
3. The client receives HIV testing.
4. The client receives results of HIV test and post-test counseling.
   - **4a. HIV-positive clients** are referred or linked to HIV care and treatment services.
   - **4b. HIV-negative clients** are counseled on all methods of HIV prevention, including PrEP.
5. The health care worker screens the client using the Pre-Exposure Prophylaxis (PrEP) Screening for Substantial Risk and Eligibility form.
   - **Note:** The Pre-Exposure Prophylaxis (PrEP) Screening for Substantial Risk and Eligibility form should be started when the health care worker introduces PrEP to a client, regardless of whether the client is interested in starting PrEP. This is because 1) the purpose of the PrEP screening form is to assess eligibility for PrEP, not interest; and 2) the PrEP screening form is also meant to capture clients declining PrEP.
7. **The client accepts or declines PrEP.**
8. The health care worker completes the Pre-Exposure Prophylaxis (PrEP) Screening for Substantial Risk and Eligibility form and records the information in the PrEP Screening Log.
9. **If client accepts PrEP:** The health care worker begins completing the PrEP Facility Record.
   - **Note:** HBV and creatinine information on the PrEP Facility Record will be completed later, when lab results are available.
10. **If the client declines the health care worker's offer of PrEP:** The healthcare worker assesses and documents the reasons for the response and provides additional risk reduction and prevention counseling and referrals.
11. The health care worker provides PrEP adherence and combination prevention counseling (using the Integrated Next Step Counseling Flow.)
12. The health care worker completes a regular client physical exam, including screening and treatment for STIs and other infections and a pregnancy test (if needed).
13. The health care worker provides a PrEP prescription and an appointment card with the date of the next scheduled PrEP follow-visit.

14. Laboratory samples are collected for HBV and serum creatinine tests. HBV and creatinine labs may be collected at any point after the client accepts PrEP and before the client leaves the clinic.

15. The PrEP prescription is filled and dispensed, and the client leaves the facility. Each country should create a PrEP Dispensing Log.

16. The health care worker completes the PrEP Client Register.

**PrEP Client and Clinic Flow—Follow-Up Visit Steps**

> Health care workers should use the Provider Checklist for Follow-Up PrEP Visits as a guide throughout follow-up PrEP visits.

1. Health care worker checks creatinine laboratory results and records the results in the PrEP Facility Record.

2. The health care worker calls clients with out-of-range calculated creatinine clearance to stop PrEP.

3. The client arrives at facility for a scheduled PrEP follow-up visit.

4. The client receives HIV pre-test counseling.

5. The client receives HIV testing.

6. The client receives the results of the HIV test and post-test counseling.
   6a. HIV-positive clients are referred or linked to HIV care and treatment services. The health care worker completes the Seroconversion Tracker.
   6b. HIV-negative clients continue in the PrEP program.

7. The health care worker discusses HBV and creatinine lab results with the client.
   7a. If the client tested positive for HBV, the health care worker considers treatment for HBV per the national guidelines and counsels client about possible HBV viremia rebound.
   7b. If the client tested negative for HBV, the health care worker should discuss the client getting the HBV vaccination (if available in country).

8. The health care worker confirms the client’s desire to remain on PrEP.

9. The health care worker screens the client for substantial risk for HIV infection using the Provider Checklist for Substantial Risk job aid.

10. The health care worker assesses for signs and symptoms of AHI.

12. The health care worker assesses and manages PrEP side effects.

13. The health care worker provides risk reduction counseling.

14. The health care worker completes a regular client physical exam, including screening and treatment for STIs and other infections and a pregnancy test (if needed).

15. The health care worker refills the PrEP prescription and completes an appointment card with the date of the next scheduled PrEP follow-visit.

16. Laboratory samples are collected for serum creatinine tests every 6 months.

17. If a creatinine test comes back abnormal, PrEP is stopped.

18. The PrEP prescription is refilled and dispensed.

19. The health care worker completes the follow-up sections of the PrEP Facility Record and PrEP Client Register.

**DISCONTINUING PrEP**

**Steps for Discontinuation of PrEP**

1. With the client, the health care worker assesses the reasons for stopping PrEP and records them in the PrEP Facility Record and PrEP Client Register.

2. The health care worker counsels the client to continue PrEP for 28 days after the last possible HIV exposure, unless contraindicated by WHO guidelines.

3. The health care worker educates the client about AHI.

4. The health care worker counsels the client on the use of alternative prevention methods and provides condoms, lubricants, and referrals to available harm reduction services as appropriate.

5. The health care worker discusses the possibility of PrEP re-initiation in the future.

**Additional Steps**

1. The health care worker completes the Monthly Summary Form every month for all clients screened for PrEP.

2. The health care worker completes the PrEP Quarterly Cohort Report every quarter for all clients initiated on PrEP.
PrEP OUTREACH FOR FOLLOW-UP

When a client misses a PrEP follow-up appointment (i.e., has a “missed PrEP appointment”), an outreach worker or health care worker should do the following:

1. Try to contact the client by phone within 24 hours of the missed appointment.
   - If the client is reachable by phone, reschedule the appointment for the earliest possible date.

2. Add names of clients not reachable by phone to a roster of clients needing home or community visits.
   - Attempt to visit the client at home or in the community using the contact information you have on file.
   - If the client is located and engaged through outreach, reschedule the PrEP appointment for the earliest possible date.
     - If a client does not wish to return to the clinic, provide counseling on the importance of HIV testing before discontinuing PrEP.
     - Update the PrEP record to indicate that the client has discontinued PrEP and why.
   - If the client is not located and engaged, continue outreach for 90 days after the missed appointment.
     - Continue to attempt to contact the client by phone (if applicable).
   - Document all attempts to reach “missed PrEP appointment” clients and the outcomes.

3. After a “missed PrEP appointment” client misses a PrEP appointment by more than 90 days, reclassify him or her as lost to follow-up (LTFU).
   - You may make a final attempt to reach the client at 90 days, but after that, no further outreach is attempted.
   - For clients who have not been reached and/or who do not provide sufficient information to be classified as another outcome after 90 days (i.e., PrEP-discontinued client), document the client’s LTFU status in the appropriate PrEP record and register.

PrEP CLIENT DEFINITIONS

PrEP-Initiated Client—Has completed the PrEP eligibility screening form and initiated PrEP.

PrEP-Declined Client—Has completed the PrEP eligibility screening form and was determined to be eligible, but declined the offer of PrEP.

PrEP-Discontinued Client—Has initiated PrEP but has been documented as declining to continue taking PrEP for any reason.

Missed PrEP Appointment—Initiated PrEP and missed a follow-up appointment in the last 90 days.

Lost to Follow-Up—Initiated PrEP and missed a follow-up appointment by more than 90 days.
MODULE 5 SUMMARY

- Tracking PrEP screening data can inform increased outreach and education efforts and IEC materials.
- Tracking PrEP seroconversion data will help ensure appropriate linking and follow-up on clients diagnosed with HIV and can facilitate reporting of seroconversions for surveillance.
- Clients who present more than once for PEP may be candidates for PrEP. Engage these clients in sustained risk reduction and HIV prevention services, including PrEP.
- If your facility has multiple points of entry, consider adapting the PrEP M&E tools to capture these points.
MODULE 6: POST-TRAINING ASSESSMENT, EVALUATION, AND CLOSING

The trainer will provide the Post-Training Assessment and the Training Evaluation Form.
APPENDIX

A. Pre-and Post-Training Assessment
B. Materials in Participant Folders
C. PrEP Clinical Pathway
D. Screening for Substantial Risk of HIV infection
E. Provider Checklist for Initial PrEP Visit
F. Provider Checklist for Follow-Up PrEP Visit
G. Provider Checklist for Substantial Risk
H. Frequently Asked Questions about PrEP
A. Pre- and Post-Training Assessment for PrEP Training for Providers in Clinical Settings

Please tick the correct answer to each question below:

1. Is the following statement true or false? “Pre-exposure prophylaxis (PrEP) is a medication you take for life.”
   a) True
   b) False

2. Counseling to support PrEP use and adherence may be provided by:
   (Select all that apply.)
   a) Pharmacists
   b) Nurses
   c) Lay counselors
   d) Peer workers

3. Which of the following are WHO-recommended regimens for PrEP?
   (Select all that apply.)
   a) Tenofovir/emtricitabine (TDF/FTC)
   b) Tenofovir/emtricitabine + efavirenz (TDF/FTC) + (EFV)
   c) Tenofovir/lamivudine (TDF/3TC)
   d) Zidovudine/lamivudine (AZT/3TC)

4. Is the following statement true or false? “PrEP is safe to use during pregnancy and breastfeeding.”
   a) True
   b) False

5. PrEP is safe to use with:
   (Select all that apply.)
   a) Hormonal contraception
   b) Recreational drugs
   c) Alcohol
   d) Antibiotics

6. PrEP should be discontinued if:
   (Select all that apply.)
   a) The health care worker decides it is no longer right for the client
   b) The estimated creatinine clearance decreases to <60 ml/min
   c) The client reports headaches and stomach upset
   d) The client tests HIV positive
7. Is the following statement true or false? “PrEP and post-exposure prophylaxis (PEP) are both used by HIV-negative persons to prevent HIV acquisition”
   a) True
   b) False

8. PrEP can be offered as part of a comprehensive HIV prevention package for:
   (Select all that apply.)
   a) Men who have sex with men
   b) Individuals with potential HIV exposure in the last 72 hours
   c) People who inject drugs
   d) Serodiscordant couples

9. Is the following statement true or false? “PrEP is protective against a variety of sexually transmitted infections.”
   a) True
   b) False

10. Is the following statement true or false? “PrEP is a new drug.”
    a) True
    b) False

11. Counseling to support PrEP adherence should include:
    (Select all that apply.)
    a) A client-centered approach
    b) Identification of barriers to taking PrEP
    c) Identification of client-specific strategies to use PrEP effectively
    d) Integration of condom use
B. Materials Needed for Participant Folders

Each participant folder should include:

1. Pre-Training Assessment
2. Post-Training Assessment
3. Training Evaluation Form
4. PrEP Job Aids
   a. PrEP Clinical Pathway
   b. Screening for Substantial Risk of HIV Infection Chart
   c. Provider Checklist for Initial PrEP Visits
   d. Provider Checklist for Follow-Up PrEP Visits
   e. Provider Checklist for Substantial Risk
   f. Frequently Asked Questions about PrEP
5. The PrEP M&E Tool Package, including:
   a. Pre-Exposure Prophylaxis (PrEP) Screening for Substantial Risk and Eligibility
   b. PrEP Screening Log
   c. PrEP Facility Record
   d. PrEP Client Register
   e. Seroconversion Tracker
   f. PrEP Monthly Summary Form
   g. PrEP Quarterly Cohort Report
C. PrEP Clinical Pathway

Confirm HIV Negative Status
- Perform rapid HIV test according to national guidelines/algorithms.
- Link HIV-positive persons promptly to care and treatment services

Screen for Substantial Risk for HIV

Establish Eligibility
- Client who is sexually active in a high-HIV-prevalence population (either in the general population or key population group) plus reports any of the following in the past 6 months:
  - Vaginal or anal intercourse without condoms with more than one partner, OR
  - Sex partner with one or more HIV risk, OR
  - History of a sexually transmitted infection (STI), based on lab test, syndromic STI treatment, or self-report, OR
  - History of use of post-exposure prophylaxis (PEP)
- OR
- Client who reports history of sharing of injection material/equipment with another person in the past 6 months
- OR
- Client who reports having a sexual partner in the past 6 months* who is HIV positive AND who has not been on effective HIV treatment
  - *On ART for less than 6 months, or has inconsistent or unknown adherence

PrEP Initiation
- Provide information on PrEP, the importance of adherence, the potential side effects, and a follow-up schedule.
- Screen and manage for STIs.
- Do risk-reduction counseling and provide condoms and lubricants.
- Do PrEP adherence counseling.
- Prescribe PrEP.
- Schedule a follow-up visit and provide appointment card with the date.
- Stress the importance of returning to the clinic and notifying a provider if side effects or signs and symptoms of acute HIV infection develop.

PrEP Follow-Up Visits
- Plan follow-up visits 1 month after starting PrEP and every 3 months thereafter.
- At follow-up visits:
  - Repeat the HIV test.
  - Ask about side effects.
  - Support and monitor adherence.
  - Do risk-reduction counseling.
  - Do family planning counseling, and provide condoms and lubricants.
  - Screen for STIs.
  - Repeat eGFR after 6 months on PrEP.
  - Prescribe PrEP.
  - Schedule a follow-up visit and provide appointment card with the date.
D. Screening for Substantial Risk of HIV Infection *(based on history in the past 6 months)*

- Client who is sexually active in a high HIV prevalence population (either in the general population or key population group) PLUS reports ANY of the following in the past 6 months:
  - Vaginal or anal intercourse without condoms with more than 1 partner, OR
  - Sex partner with one or more HIV risk, OR
  - History of an STI (based on lab test, syndromic STI treatment, self-report), OR
  - History of use of post-exposure prophylaxis (PEP)

- OR

- Client who reports history of sharing of injection material/equipment with another person in the past 6 months

- OR

- Client who reports having a sexual partner in the past 6 months* who is HIV positive AND who has not been on effective HIV treatment
  
  *On ART for less than 6 months, or has inconsistent or unknown adherence
E. Provider Checklist for Initial PrEP Visit

- Conduct HIV testing (using the algorithm in the national HIV testing guidelines). Assess on HIV infection status.

- Exclude acute HIV infection.
  - Ask about the last potential exposure to HIV.
  - Ask about and look for flu-like symptoms.

- Screen for substantial risk for HIV.

- Screen for signs and symptoms of kidney disease.
  To identify potential pre-existing renal impairment if lab results are not available on the day of testing.

- Conduct serum creatinine testing (calculate eGFR).
  Absence of creatinine results should not delay PrEP initiation. Providers should do same-day initiation of PrEP, then discontinue PrEP if a patient’s eGFR is not within the appropriate range.

- Screen for hepatitis B (HBsAg).
  - To identify undiagnosed hepatitis B (HBV) infection.
  - To identify those eligible for vaccination against hepatitis B.

- Screen for sexually transmitted infections (STI).
  - Perform syndromic and etiological STI testing (depending on local guidelines).
  - Rapid plasma reagin test (RPR) for syphilis (if available).

- Conduct risk reduction counseling.
  - Refer clients based on needs (i.e., for social support, harm reduction, gender-based violence programs, etc.).

- Counsel on family planning.
  - Perform a pregnancy test for women.
  - Provide condoms and lubricants.
  - Provide other contraception.

- Provide information on PrEP, including potential side effects; schedule a follow-up visit.

- Conduct PrEP adherence counseling.

- Prescribe PrEP.

- Schedule the next PrEP follow-up appointment, and provide an appointment card.

*This checklist to be aligned with national guidelines on PrEP.
F. Provider Checklist for Follow-Up PrEP Visits

- **Brief PrEP Counseling**
  - Ask about signs and symptoms of acute HIV infection.
  - Assess for substantial ongoing risk for HIV.
  - Confirm the client wishes to remain on PrEP.
  - Review facilitators and barriers to PrEP use.

- **Adherence Counseling**
  - Assess adherence and adherence challenges.
  - Provide adherence counseling.
  - Discuss the importance of effective use of PrEP.

- **Assessment and Management of Side Effects**
  - Ask about and manage side effects.

- **Confirmation of HIV-Negative Status**
  - Repeat HIV test 1 month after starting PrEP, then every 3 months thereafter.

- **Calculation of Estimated Creatinine Clearance (eGFR): Recommended Frequencies**
  - At least every 6 months—more frequently if there is a history of conditions affecting the kidney (e.g., diabetes, hypertension, any chronic nephropathy).
  - Check creatinine test results, calculate creatinine clearance, and add the results to the appropriate forms.

- **Screening for Sexually Transmitted Infections (STIs)**

- **Risk Reduction Counseling**
  - Refer clients based on their specific needs (i.e., for social support, harm reduction, gender-based violence programs, etc.).

- **Counseling on Family Planning**
  - Perform a pregnancy test for women, if indicated.
  - Provide condoms and lubricants.
  - Provide other contraception.

- **PrEP Prescribed**

- **Schedule next appointment, and provide appointment card**

**STOP PrEP**

when a client using PrEP tests positive for HIV
and link promptly to treatment and care services.
Start ART for HIV infection immediately.

* Checklist to be aligned with national guidelines on PrEP *
G. Provider Checklist for Substantial Risk

Providers should assess for a client's substantial risk at each PrEP follow-up visit by asking the questions below. *If at least one item is ticked, the client is at substantial risk.*

Have you...

- Had vaginal sexual intercourse with more than one partner of unknown HIV status in the past 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Had vaginal sex without a condom in the past 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Had anal sexual intercourse in the past 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Had sex in exchange for money, goods or a service in the last 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Injected drugs in the past 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Been diagnosed with a sexual transmitted infection (STI) more than once in the past 12 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Taken post-exposure prophylaxis (PEP) for exposure to HIV in the past 6 months?
  Y ☐ N ☐ (If yes, tick substantial risk.)

- Do you have a partner who is living with HIV?
  Y ☐ N ☐ Don’t know ☐ (If no or don’t know, continue to Client Risk Classification.)

- Is your HIV-positive partner on ART?
  Y ☐ N ☐ Don’t know ☐ (If no or don’t know, tick substantial risk.)

- Has your HIV-positive partner been on ART for at less than 6 months?
  Y ☐ N ☐ Don’t know ☐ (If no or don’t know, tick substantial risk.)

Client Risk Classification

☐ SUBSTANTIAL RISK *(At least one item indicating substantial risk is ticked above)*

☐ NOT AT SUBSTANTIAL RISK *(If none of the substantial risk items above are ticked)*
H. Frequently Asked Questions about PrEP

What is PrEP?
PrEP stands for pre-exposure prophylaxis. It is a single daily pill that protects you from getting infected with HIV. It works when you take it before you are exposed to HIV.

Who should use PrEP?
PrEP is for anyone (both men and women) who is at substantial risk of becoming infected with HIV. It is for situations and times when you may have a high risk of HIV infection.

Is PrEP a new drug?
No. PrEP is not new. PrEP is made of antiretroviral drugs (HIV medication) used to help treat people who are HIV positive and for preventing mother-to-child HIV transmission (PMTCT).

When and how do I use PrEP?
• See a health care provider to find out if you are eligible for PrEP.
• If you are prescribed PrEP, you must take 1 pill every day.
• You can take PrEP any time of day and at different times on different days, as long as you take 1 pill every day.
• You can take PrEP with or without food.
• When starting or re-starting PrEP, you must take it every day for at least 7 days before you are protected.
• You must see your health care provider for regular follow-up visits while on PrEP.
• While taking PrEP, you must test for HIV every 3 months to be sure you are not infected.

How long do I use PrEP?
PrEP is recommended as added protection for people who are at substantial and ongoing for HIV infection. For most people, PrEP will not be a lifelong medication. It is for a time in your life when you feel you are regularly or frequently at risk for HIV. As part of your follow-up care for PrEP, your health care provider will help you assess your risk and decide whether or not PrEP is still appropriate for you. If you wish to stop PrEP, talk to your health care provider about how to safely stop.

How well does PrEP work?
PrEP does not provide 100% protection, but it is highly effective and provides a great deal of protection against HIV. Among clients who take PrEP consistently, as prescribed, PrEP reduces the risk of HIV infection during sex by over 90%.

What if I miss a dose?
If you miss a dose, just take it when you remember. For example, if you usually take PrEP in the morning, but one day realize at 10 in the evening that you forgot, it is okay to take 1 pill then and resume your usual morning schedule the next day. Remember, PrEP is effective when taken every day.

Is PrEP an HIV vaccine?
No. PrEP is not an HIV vaccine. PrEP is a pill that works only when taken consistently and correctly—1 pill every day. Unlike a vaccine, PrEP stops working once you stop taking it.
Will I have side effects while taking PrEP?
You may experience some side effects—like nausea, vomiting, or abdominal pain—but these usually stop within the first weeks of starting PrEP.

Will PrEP affect my liver?
No. Several studies have shown that PrEP medication does not affect the liver. However, the same medication used for PrEP is also used to treat hepatitis B (a liver disease), so before you start PrEP, you should first be screened for hepatitis B to make sure your liver is okay.

Will PrEP affect my kidneys?
For some clients, PrEP can affect the kidneys. It is important for PrEP clients to have their kidneys checked regularly by a health care provider, using a creatinine test, because kidney problems caused by PrEP may not be obvious or show any symptoms.

Can I take PrEP if I use alcohol or drugs?
Yes. PrEP works if you drink alcohol and/or use recreational drugs. However, alcohol and drug use can cause you to forget to take PrEP. See your provider if you need help with alcohol or drug use.

Will PrEP work if I am HIV positive?
No. PrEP is only for HIV-negative people. You must be tested regularly for HIV while taking PrEP.

I just had sex without a condom with someone who is HIV positive. Should I take PrEP?
No. PrEP works only when it is taken before you are exposed to HIV. If you have sex with someone whom you believe may be HIV positive, go immediately to a health care provider and ask for PEP (post-exposure prophylaxis).

If I take PrEP every day, can I stop using condoms?
No. PrEP does not protect against other sexually transmitted infections (STIs) or pregnancy, as condoms do. Condoms also provide additional protection against HIV. You should use condoms even when taking PrEP.

Can I use PrEP and hormonal contraception (e.g., oral, injectable, implants) at the same time?
Yes. It is safe to use PrEP and hormonal contraception (i.e. birth control) at the same time. Taking them together does not make them less effective.

Do I have to tell my partners that I am taking PrEP?
No. PrEP can be private. You do not have to tell anyone that you are taking PrEP unless you want to. However, people sometimes find it helpful to tell a partner, friend or family member that they are taking PrEP so that people can help support their PrEP use.

Will PrEP cause erectile dysfunction, “loss of man power,” sterility, or infertility?
No. Over several years, men who have taken PrEP have not had any of these problems.

Can I use PrEP if I am pregnant or breastfeeding?
Yes. It is safe to use PrEP during pregnancy and breastfeeding.

Can I take 2 PrEP pills just before having sex to avoid getting HIV?
No. To avoid possible side effects, you should take your PrEP medication every day as prescribed.
Can both my partner and I take PrEP?
Yes. PrEP is for all people at substantial risk of HIV.

Can I give PrEP to my children if they are sexually active?
No. To ensure proper screening and follow-up, PrEP can be given only by professional health care workers. If you think your child is at substantial risk for HIV infection, seek services at a clinic.

When and how can I stop PrEP?
Starting PrEP does not mean taking PrEP for the rest of your life. You may stop if you are no longer at substantial risk for HIV infection. However, after your last potential HIV exposure, you should keep taking PrEP for 28 more days. If you want to stop PrEP, see your health care provider.

What else can I do to stay HIV negative?
- Use PrEP together with other ways of preventing HIV including:
  - Use condoms every time you have sex.
  - Get regular HIV testing for yourself and your partners.
  - Get screened and treated for STIs.
  - Get counseling and support to reduce behaviors that put you at risk for HIV.

How does PrEP compare to PEP (post-exposure prophylaxis)?
- You take PrEP before you are exposed to HIV; you take PEP after you are exposed to HIV.
- PrEP is taken as long there is substantial risk for HIV infection.
  - PEP is taken for only 28 days after exposure to HIV.
- Both are given by health care providers to HIV-negative people to keep from getting HIV.
- Both must be taken correctly and consistently to work well.
- Both use HIV treatment medication to help stop HIV infection in those exposed to HIV.

What other countries are using PrEP?
The medication in PrEP has been approved in the United States, South Africa, Brazil, Peru, Kenya, Canada, Australia, Belgium, Botswana, Czech Republic, Denmark, United Kingdom, France, Lesotho, Namibia, Netherlands, Taiwan, Thailand, Zambia, Zimbabwe, and others.

REMEMBER
- PrEP is a pill you take once a day to prevent HIV infection.
- PrEP works best if you take it every day as prescribed.
- If you take PrEP as prescribed, it will stop you from becoming infected with HIV.
- PrEP does not protect against other STIs or pregnancy.
- PrEP is private. You do not have to tell anyone you are using it.
- PrEP is safe. Mild side effects, which some people experience, usually go away after the first few weeks.
- You must take PrEP under the care of a health care provider and go to the clinic for regular follow-up visits.
- PrEP is not a lifelong medication. It is for a time of life when you feel at substantial risk of HIV exposure.
